Add support for Rich Text Content Controls Completed

- JW John Wahlström
- **Forum name:** #GemBox.Document Feature Request

When working with word we're very often using Rich Text Content Controls (RTCC), which can have nested RTCC as well. Would be very handy to be able to access, clone, delete and modify these to extend the possibilities to work with nested contents, and larger portions of data at the time (Delete a full RTCC etc with all it contents) .

By working with RTCC you can give the Control a name and therefore look for a specific RTCC with a specific name etc.
