Support conversion of HTML inline text formatting to Excel Completed

- AD Alex Dortok
- **Forum name:** #GemBox.Spreadsheet Feature Request

It is very important for me to have inline text formatting in HTML to be translated to Excel. Sometimes I have the formatting specified in style attributes and sometimes I have tags, or , <u>, and <i>. The most important inline font stylings for me are size, underline, colour, bold and italic.

I would love for simple tags (

, , etc) tags to be able to used when adding content to a cell. Is this possible? If so, how? Thanks!

Hi, Yes, this is possible, this feature is in "Completed" stage. Please try the following example: ExcelFile ef = new ExcelFile(); ExcelWorksheet ws = ef.Worksheets.Add("Sheet1"); ExcelCell cell = ws.Cells["A1"]; cell.SetValue("**Foo Bar**", LoadOptions.HtmlDefault); ef.Save("Sample.xlsx"); I hope this helps. Regards, Mario
