Support conversion of HTML inline text formatting to Excel Completed

- Alex Dortok
- **Forum name:** #GemBox.Spreadsheet Feature Request

It is very important for me to have inline text formatting in HTML to be translated to Excel. Sometimes I have the formatting specified in style attributes and sometimes I have tags, or , <u>, and <i>. The most important inline font stylings for me are size, underline, colour, bold and italic.

I would love for simple tags (
, , etc) tags to be able to used when adding content to a cell. Is this possible? If so, how?

Thanks!

Hi,

Yes, this is possible, this feature is in "Completed" stage.

Please try the following example:

```
ExcelFile ef = new ExcelFile();  
ExcelWorksheet ws = ef.Worksheets.Add("Sheet1");  
ExcelCell cell = ws.Cells["A1"];
```

```
cell.SetValue("<span ><strong>Foo</strong> <em>Bar</em></span>", LoadOptions.HtmlDefault);
```

```
ef.Save("Sample.xlsx");
```

I hope this helps.

Regards,
Mario
