## Support internal and external CSS in HTML Completed

- JS Jatinder Singh
- **Forum name:** #GemBox.Document Feature Request

I am looking for feature in GemBox document dll which could support the css inline and external both and the output in pdf should look exactly as in the html

Hi, GemBox.Document currently only supports inline styling (style attribute in HTML elements). This feature request is for adding support for internal styling ([style] tags) and external styling (external CSS files). Regards, Mario

I am eagerly waiting for this feature as it is very much mandatory for my existing project. Please incorporate this in your upcoming version as soon as possible.

Is there any update on this? I'm interested in it for a project that is going live in a few weeks. I wasn't aware that GemBox would ignore CSS styling when we selected the product.

Hi, This will be implemented sometime in the future, but unfortunately, it is not in our current roadmap. However as a workaround for now you could convert the internal and external CSS into inline styling. There are some available .NET utility libraries that can achieve this conversion: https://stackoverflow.com/questions/5066667/net-convert-external-css-to-inline-css I hope this helps. Regards, Mario

Hi, The CSS is supported by default, in other words, there is no option that you need to set to enable this. By using the "DocumentModel.Load(string, HtmlLoadOptions)" method GemBox.Document will read the HTML content and any linked CSS content. I hope this helps. Regards, Mario

Hi, Yes, this is done by default. All linked CSS files (e.g. "[link href="style.css" rel="stylesheet"]") are loaded when loading HTML file. Regards, Mario
